EXERCISES

1-Write a method that takes two integer paramaters and decides whether the fist one is divisible by the second.

2- Write a method that takes an integer n and x as a parameter and calculates the e using the formula below. You should have three different functions.

$$e^x = \frac{x^0}{0!} + \frac{x^1}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \cdots$$

3-A Strange number is an integer such that the sum of the cubes of its digits is equal to the number itself. For example, 371 is a Strange number since 3 ** 3 + 7 ** 3 + 1 ** 3 = 371. Write a method that takes a 3 digit number as a parameter and decides whether it is a Strange number or not.

4-Write a method called intersectArrays that takes two integer arrays as parameters and return a new array which is the intersection of those given arrays. Assume that each array contains unique numbers in itself.
